end-to-end data (science) pipelines design, building and operationalization | **monitoring** business-KPIs and model performance

FROM RAW DATA TO BUSINESS ASSETS

data scientist | **+10 years experience** in different sectors | **oriented to business** processes | **task & timings** management | **agile** methodologies
end-to-end data (science) pipelines design, building and operationalization | **monitoring** business-KPIs and model performance

1 Projects about ML/AI, usually, born from an **idea around some business needed or improvement**. Advising on the viability of the business goal, evaluating available resources, linking with data and systems areas, to define the model approach.

4

I perform **Exploratory Data Analysis (EDA)** to get data knowledge and business insights

- **Feature descriptives** give us knowledge about data at business (understanding, interpreting) and technical level (**modeling features, missings, datatypes, values, univariate analysis, outliers, skewness, scaling or transformation, etc**).
- **variables interaction** (specifically, with target in supervised models), correlations, PCA
- **statistical testing** for population **samples comparison (A-B tests)**, hypothesis checks

In according with each project or business case, one or the other is suitable

From “my side” key points are:

- Define **target variables and features**, and their availability.
- Data sources and volume
- Systems and **(multi-)cloud platform** (my **core have been AWS** but i have worked in projects with **GCP and Azure**)

3

To build the data inputs i’m **proficiency on SQL**. I have worked with several “dialects” (postgres, HiveQL, sparkSQL), storages, fileformats, and technologies,

- **core in AWS-Redshift, AWS-S3 (7+ years)**
- respect to **BigData technologies** i have worked with Hive, Hue, hdfs, parquet, spark,
- **NoSQL** storage and querying over **ELK, AzureSearch, Solr**
- **Input text** processing, parsing, **chunking, embedding for GenAI** projects.
- Also, i have worked with **graph-databases; OWL, RDF, SparQL**

end-to-end data (science) pipelines design, building and operationalization | **monitoring** business-KPIs and model performance

4

To **model or data analysis**, i use **python (last 6 years) and R (+4 years)**.

Usually, I use **pandas, numpy, sklearn**. But, i have used too many **packages in according with the project goal and needed**. Also, some knowledge in **tensorflow** and **keras**

Regarding R, my preferences were **datatable** VS **dplyr** and **caret** (pycaret) was a good model package (among others)

5

- Several **model approaches**; many times associated with scientific research and **state-of-the-art** about the topic
- **classification and regression. Supervised and non-supervised. Clustering. Optimization. Explainability**
- Tree-based models, gradient descent, shap
- **hyperparameters** tuning

ML / AI PIPELINE

Tackled business-cases;

- **customer life-time value**
- **churn-model**
- **product recommender**
- **binary classifiers (different targets)**
- **purchase probabilities**
- **anomaly-detection**
- **forecasting and demand estimation**
- **segmentations and profiling**
- **GenAI RAGs and NLP**

6

I have **start-up models in production environments**; **deploy** (core in **AWS, docker, airflow**. Also, **mlflow, Azure, GCP**) and **monitoring** (**dash, grafana**), **model metrics or KPIs** (conversion or churn rates, revenue, mean-ticket, etc)

I have involved in tasks around **MLOps and data-engineering** tasks and procedures and i worked in **cross-functional** environments.

I have been projects **technical-lead (supervision and mentoring)** and **owner** of them, **managing with stakeholders the development, production maintenance, and exploitation (monetization)**. Model releases management.
